# Mobile Design and Architecture.

The mobile UI is fairly simple to understand and use. When the user opens the app, they will be able to add a new device to the dashboard. When they open the device card, it will present them with the device manager page, where the user will have the control to manually turn on the device fan and view the temperature and humidity from that specific device. Each device has a unique id which will be used to find the device and connect to it. The user also has the ability to add a name to the device for reference.
